

### **Issues in technology systems**

Some issues of the technology systems involve fires due to people overclocking their hardware and not regulating the temperature of the hardware. This can then set fire to the processor thus setting fire to other components of the computer then making the fire expand. Another issue of technology systems is that there is a lot of cables involved E.G. Ethernet cable and power cable. These cables can be hazardous if not covered up correctly. These can cause people to trip and break bones or destroy equipment.
